

The backend is built. Here is what it does, and what I need from you

Everything in the backend plan is now written and tested on a test copy of the website. Three things are still missing: the **server and domain** (you are sending them tonight), **Psoola's documents and test keys**, and the **prices**. None of these needs a rebuild. Each one is a setting or a small, marked piece of code.

88 / 88

automatic checks pass

12

new admin pages

13

database tables

3

languages: EN · AR · KU

1 How it works now

Students upload their student ID. Someone approves it in the admin first. Then they get a "Pay now" email, pay, and receive their ticket. **Professionals** pay straight away.

2 What I built

Part	What it does	State
Registration page	Asks the server whether registration is open. Sends the form to the server, not WhatsApp. Goes to Psoola to pay. Shows "Registration opens soon" while closed, and has a hidden trap that catches spam bots.	done, tested
Payment page (new)	Where people land after paying: "Checking...", then "You are in!" with the QR code, or "Payment did not go through" with a <i>Try again</i> button.	done, tested
Student ID page (new)	A rejected student sends a new photo from the link in their email.	done, tested
Sponsor form	Saved on the server with a reference (SPN26-...); the sponsor team is emailed. Falls back to WhatsApp/email if the server cannot be reached, so no request is ever lost.	done, tested

Emails	Registration received, Pay now, ticket (PDF + QR), student approved or rejected, one reminder after 3 days unpaid, and sponsor emails. Written in all three languages.	done, tested
Admin at <code>/admin/</code>	Dashboard · Registrations (search, filters, duplicates, export to Excel) · one registration · Student approvals · Payments (red flags, daily totals, refunds) · Workshops (phone bookings) · Sponsors & booths · Check-in (phone camera QR scan) · Settings · Users · Export.	done, tested
Timed jobs	Every minute: send emails. Every 5 minutes: re-check unfinished payments with Psoola. Nightly: database backup, and student ID photos deleted 90 days after the summit.	done, tested
Publishing tools	The cPanel "Deploy" button goes to the test site first, then live. Updates never overwrite prices or texts you changed in the admin.	done, tested
Psoola connection	Everything around it is ready. Three marked places need Psoola's documents: create a payment, check a payment, and verify their message. Until then a pretend Psoola runs on the test site so every case can be tested.	waits for Psoola

3 What it looks like (test site, test prices)

The registration page is currently closed. It features a sidebar with ticket options: Professional (150,000 IQD), Student (75,000 IQD), and Lunch (15,000 IQD). The main content area displays a message: 'Registration opens soon. Online registration is not open yet. Follow iSmile for the opening date, or write to us. info@ismile.krd'.

Registration page while closed. You can write your own message (e.g. the opening date) in Settings.

After payment, the user is confirmed as 'in'. The page displays a welcome message: 'You are in! Welcome to iSmile 2026'. It includes a QR code for the ticket and a reference number 'ISM26-CB4TNZ'.

After paying: "You are in!" with the ticket QR code.

The admin dashboard provides an overview of the event's financial and registration status. It includes a 'Needs attention' section with a list of issues: '4 payment(s) need Finance: wrong amount or paid twice. No ticket was made for them. Open', '2 payment message(s) with a bad signature in the last 24 hours (possible fakes; nothing was changed). Open', and 'Open sponsor requests oldest new: 27 Sep, 18:58'.

Admin dashboard: the big numbers, and a red box for anything that needs attention.

The settings page (Owner only) allows the owner to configure the event's registration, capacity, and email test mode. It includes fields for registration status, capacity, and email test mode.

Settings (Owner only): open or close registration, capacity, and email test mode.

Ticket email (Kurdish shown). The PDF ticket is attached.

The PDF ticket. The QR code is signed, so a fake or copied ticket is refused at the door.

The screenshots use made-up test prices. The real `data/tickets.json` still says **0** for every price, and a price of 0 cannot be paid: registration cannot even be opened until the prices are set.

4 How I checked it

✓	88 automatic checks run against the test site, like a real visitor and a real Psoola would. Paid, failed, and wrong-amount payments. Paid twice, lost webhook, fake webhook. Student approve and reject, full capacity, lunch limits, reminders, backup, rate limits, and sign-in rules. All 88 pass, including 11 new ones added after the security review.
✓	Browser tests of the whole path, in English and Arabic: professional pays, student with ID photo, failed payment and try again, sponsor form, and every admin page. No errors.
✓	Every PHP file passes the syntax check (PHP 8.1, the version cPanel hosting has).
✓	A separate security review of all the new code. Results are in section 5.

Safety rules the code enforces

- **No ticket without money confirmed by Psoola.** The browser can never say "paid". Our server asks Psoola directly and checks the amount and currency.
- **The server sets the price** from the admin, never the page. A price of 0 cannot be paid.
- **Paid twice?** Only one ticket is made. The second payment is flagged red for Finance to refund.
- **Admin:** each person has their own account and role. There is a phone code (two-factor) for Owner and Finance. Five wrong passwords lock the account for 15 minutes. Every action is written to the audit log.
- **Student ID photos** are stored outside the website, shown only to signed-in staff, and deleted after the summit.
- **Test mode:** until launch every email goes to one test address, so no real person gets a test ticket.

5 Security review

A second, independent check read all the new code looking for ways to break it. It confirmed that the main safety rules hold. It found **6 real problems**, and all 6 are now **fixed**, each with a new automatic check that proves it.

#	Problem found	Now
---	---------------	-----

1	After signing in, a trick link could send an admin to a fake website.	fixed
2	If a card was declined and the person then paid on the same Psoola page, the money could be taken with no ticket.	fixed: ticket made
3	A link that kept failing (Psoola down) could send "Pay now" emails again and again.	fixed: max 1 a day
4	Switching registration off did not stop "Pay now" links.	fixed: stops all payments
5	Many people paying for the last few places at the same moment could oversell tickets or lunch.	fixed: places held while paying
6	A rejected student could be approved before sending a new photo.	fixed
+	Also fixed: the pretend Psoola can never run on the real address, even if a setting is copied wrongly. Odd links no longer cause error pages, and very large photos are refused.	fixed

Before go-live (after the server is up). (a) Only the Owner/Finance should change prices; today the content editor can. I will add an alert on every price change, or move prices under Owner control. (b) Check whether the hosting sits behind Cloudflare, so the spam limits count each visitor separately. (c) A used phone code should not work twice, and changing a password should sign out old sessions. These three are small and go on the go-live checklist.

6 What I need from you

you = you or the owner **Psoola** = ask Psoola **me** = I do it once I have it

Tonight: the server and the domain

#	What	Who
1	The domain (ismile.krd suggested), pointed at the hosting. The hosting company's "nameservers" go into the domain settings.	you
2	cPanel hosting with PHP 8.1 or newer, MySQL, SSL (AutoSSL), Cron Jobs, Terminal/SSH and Git Version Control. Almost every cPanel plan has all of these.	you
3	The cPanel sign-in. Please do <u>not</u> paste the password into a chat or email. Share it by phone, or create a separate cPanel user for me.	you
4	The Owner's email for the first admin account, and a phone with an authenticator app (Google Authenticator or Microsoft Authenticator) for the two-factor code.	you
5	Then I set up test.ismile.krd first (password-protected), the database, the timed jobs, and run the 88 checks on the real server. The live site comes after.	me

From Psoola (the critical path)

6	Merchant account, API documentation and test keys. These fill the three marked places in the code. The 32 questions are in " <i>Questions for Psoola</i> " on your Desktop.	Psoola
7	Register our webhook address with them: <code>https://ismile.krd/api/webhook.php</code> (and the test one: <code>https://test.ismile.krd/api/webhook.php</code>).	Psoola

8	Their fee per payment, so it can be built into the ticket price.	Psoola
---	--	--------

Decisions and numbers (type them into the admin, no code needed)

9	Prices in IQD: professional, student, lunch day 1, lunch day 2. Admin → Site content → Ticket prices.	you
10	Capacity: total tickets (from the venue), and lunches per day (from the caterer). Registration closes itself at these numbers.	you
11	People and roles: who approves student IDs, who handles sponsors, who is Finance, and who scans tickets at the door. Each person gets their own account.	you
12	Email sending: a free Brevo account (brevo.com) for tickets@ismile.krd. I add its records to the domain so emails don't land in spam.	you + me
13	Confirm: students are approved before they pay (this is how it's built now). Confirm the refund wording, whether age and gender are still needed, and the office phone number for the bottom of emails.	you

Timeline. Server tonight → test site working in 1–2 days. Psoola documents → about 2 days to connect and test with their test keys. Then prices, a real small payment on the live site, a two-person sign-off (plan, section 10), and **registration opens (target ~25 October)**.

Technical details: `backend/README.md` (setup, updates, cron jobs). Plan: *iSmile 2026 – Backend Plan* on your Desktop. All code is on this computer and not yet on GitHub.
